## CitiDirect BE® Import Setup

Citibank Kazakhstan

December 2016

# Overview

By use of the import, clients prevent duplication of payment input thus preventing time wasting and human errors.

CitiDirect allows clients to upload (import) the files, formed by them in their own ERP or by use of any tool like Excel or Access files.

Though the import process the client ERP or resource file communicate to CitiDirect. First, clients import files from their ERP or resource tool files. Then clients log to CitiDirect and there run import mode, described in CitiDirect user guide. Through the import mode, CitiDirect uploads import file, finds payment there in the file and validates them for correctness. After validation done, CitiDirect routes them to next process level like 1st authorization or pending release.

The process of import set is the next:

Clients update their ERP to generate import files for single and cumulative payments; please refer to "Import files" section of this document;

Clients update their CitiDirect for upload of the files through import mode; please refer to "CitiDirect import profile" section of this document.

## Import profile

CitiDirect sets rest of requirements to import files. Import files may have any name and extension. Files may be in next coding: DOS 866, Win 1251, UTF-8, KZ-1048.

## Tag Format Legend

In matrixes below describing import formats, "Tag format" column indicates format of tags and fields in import file.

Section below specifies all parameters, used to indicate requirements to a field or tag. Values structure in "Tag format" field is indicated as follows below:

- [LX] format indicates optional parameter, say, [2n] field is optional;
- L is field length. Underlined number indicates that the value has strong length. For example, 12n indicates that the value is strongly 12 digits length;
- X indicates field type:
  - a – alpha format, allowing only letters specified in matrix 1 below;
  - n – numeric format, allowing only digits, specified in matrix 2 below;
  - x - alpha-numeric format, allowing letters, digits and special symbols, specified in matrixes 1-3 below;
  - s1 – sum; decimal number with mandatory 2 digit after decimal point and “,” as decimal point, can vary from 0,01 till 922337203685477,58;
  - s2 – sum; decimal number with mandatory 2 digit after decimal point and “.” as decimal point;
  - d1 – date in YYMMDD format, where YY is year number (last 2 digits), MM is month number, DD is day number;
  - d2 – date in YYYYMMDD format, where YYYY is year number, MM is month number, DD is day number;
  - d3 – date in MMYYYY format, where YYYY is year number, MM is month number.

## Funds Transfer in MT 100 Format

One import file can contain no more than 10 000 payments.

The import file is composed of blocks, the blocks are composed of tags, which, in turn, from the fields.

The block begins with the first position in the new line and starts with the character "{", following the block number and the colon. Block closes with "}". The fourth block is closed symbol "}" in the first position of a new line.

Tag starts from the first position of the new row, and opens with a colon after the name of a tag, and closes with a colon, which indicates that the value of the tag. Tag may not start with "{", "CrLf" or "CrLf-}". The tag can contain only the fields that are defined in the specification later in this document. If any of the other fields are present in the tag, this payment will be loaded to CitiDirect.

The field begins with the first position of a new line and have a "/" after the name of the field as a sequence of letters and closes with "/". The fields within the tag can go in any order. Parent fields may contain child fields.

## Cumulative Payments in MT 102 Format

Specification for import file provided below. Each import file is used for one cumulative payment. Number of employees in one file must not exceed 10'000. Import file contains blocks, blocks contain tags; and tags may contain fields and subfields. Block starts from 1st position of new line and opens with "{" sign, followed by number of block and ":" sign. Block closes with "}" sign. 4th block closes with "-}", indicated in 1st position of new line.

Tag starts from 1st position of new line and opens with ":" sign, followed by name of tag, and closes with ";" sign. Then tag value is indicated. Tag value cannot start with "{", "CrLf:" or "CrLf-}". Tag might contain only fields indicated in the specification matrix below. Tags format and description section. If any other fields are present in the tag, then fail the transaction with level 1 error.

Field starts from 1st position of new line and opens with "/" sign, followed by field name in Latin capital and closes with "/" sign. Then field value is indicated. Fields within one tag might be in any order. Field can contain subfields.

Subfield also starts from 1st position of new line and opens with "/" sign, followed by subfield name in Latin capital and closes with "/" sign. Then subfield value is indicated.

Carriage return character separates the header and individual records.
